

Group-3 | CSE299.4

Safat Uddin (2311966642)

Farhan Karim (2311790642)

Faizur Rahman Zunayed (2312137642)

Backend: (Done by Safat)

- **Task list:** returns the project plus its non-archived tasks (populates assignees) for the frontend to render the task columns.
- **Create task:** validates input, creates a Task document (title, description, status, priority, assignees, dueDate, subtasks) and links it to the project.
- **Task details:** the task record with populated assignees/watchers and basic project info so the frontend can render the detail page.
- **Task updates:** apply the specific change on the Task document and record an activity entry for audit/history.
- **Subtasks**
 - **Add subtask:** appends a subtask item to the task.
 - **Update subtask:** mark complete/incomplete or edit subtask.
- **Comments:**
 - **Add comment:** creates a Comment record linked to the task and author.
 - **List comments:** returns comments with author metadata.
 - Each comment creation also adds an activity record so comments show up in the activity feed.
- **Activity:** controllers write Activity documents for notable actions (create, update, comment, subtask changes). The endpoint returns the timeline for the resource.
- **Watchers:** adds/removes the current user to the task's watchers list so they receive updates; also records activity.

Frontend: (Done by Farhan, Zunayed, Safat)

- **Task list:** Shows tasks in three columns: To Do, In Progress, Done. *(Done by Farhan)*
- **Create task:** A modal form with fields: title, description, status, priority, due date, assignees. The form validates input, sends the new task to the server, then closes and refreshes the list. *(Done by Farhan)*
- **Task view:** Dedicated page showing title, description, status, priority, assignees, subtasks, comments, activity, and watchers. *(Done by Farhan)*
- **Subtasks:** You can add subtasks and toggle them complete/incomplete. *(Done by Zunayed)*
- **Comments:** Comments are fetched from the server and shown in a scrollable area with author and time. *(Done by Zunayed)*
- **Activity:** Activity shows a timeline of actions (created, updated, commented, subtasks). *(Done by Farhan)*
- **Watchers:** Users can watch a task to follow updates; toggling watch sends a request to the server. The UI shows who is watching and updates after the server confirms the change. *(Done by Zunayed)*
- State management with Auth Context and TanStack Query for API calls. Custom hooks (use-project, use-task) for data fetching. *(Done by Safat)*
- Routes organized by feature,, TypeScript types, and API utilities with JWT token handling. *(Done by Safat)*
