

Update 4

Backend:

Done By Safat:

- Endpoint ***GET /workspace/:workspaceId/stats*** gathers all the dashboard data such as total projects and tasks, task status counts, priority breakdown, 7-day task trends, upcoming tasks (next 7 days), and recent projects.
- Endpoint ***GET /tasks/my-tasks*** shows tasks assigned to the logged-in user, including project title and workspace info (used in the My Tasks page).
- The server now handles aggregation logic, it groups and counts tasks, filters upcoming ones by due date, and prepares all data for the dashboard in frontend.
- Updated task-related queries to skip archived items and show only active tasks on the dashboard and task lists and used **Zod** to check request parameters and queries to ensure only valid data is processed.

Frontend:

Done By Zunayed:

- **UI components** added : ***StatsCard***, ***StatisticsCharts***, ***RecentProjects***, and ***UpcomingTasks*** (progress bars, charts, and summary widgets).
- Added filters, sorting, and search options that sync with the URL using ***useSearchParams***.
- The Dashboard supports workspace scoping through a ***workspaceId*** query param, and the layout enforces authentication with workspace selection in the header/sidebar.

Done By Farhan:

- The **Dashboard** now calls API and displays data through components like ***StatsCard***, ***StatisticsCharts***, ***RecentProjects***, and ***UpcomingTasks***.
- The **My Tasks** page fetches tasks from ***/tasks/my-tasks*** and shows tasks assigned to the current user.
- Implemented both **List view** and **Kanban Board** view with task cards showing status, priority, due date, and linked projects in the **"My Task"** page.

Done By Safat:

- Created React Query hooks (***use-task.ts***, ***use-workspace.ts***) to handle fetching and updating data; relevant queries automatically refresh after mutations.
